Before getting into the review, I would like to mention that the software is still in beta version and many features are still under development. With that said, let's get started with the new features of Adobe Photoshop Lightroom 5. You may have noticed that when you open Lightroom, it automatically selects the first option, "Recently Added Photos." You can change this setting in the "Organizer" section. The default is to display all photos in the order in which they were added. I personally prefer the "Recently Added" option. This option displays the photos in the order in which they were last saved, and it presents them in thumbnails. This is a welcome change because it allows you to browse through the images that have been imported recently without having to dig through all your digital photos to find them. The Luminance and Color tool allows you to adjust the overall tonal range of the photo or adjust its color balance, depending on the type of adjustment you'd like to make. And all changes are instantly reflected on the image. For instance, you can adjust the tonal range by adjusting the tint of the image. You can use the midtones to brighten up an image or reduce the shadows. Since we've already discussed before the benefits of dynamic range adjustments, I won't go over the details in this article. You can read more about the Luminance and Color tool in the "How it works" section of this review. This is a tool that many photographers use to adjust the curve of the image. As you may know, a curve is a secondary adjustment that flattens or sharpens the tonal range of the image. It's often used to bring out details in the shadows and lighten up areas that may be too dark. The Curve tool allows you to adjust the curve of the image in a radial or linear fashion.
